Description

Release Notes — Ask New Input Page

PR: #1489 — Feature/ask new
Branch: feature/ask-new → main
Author: @YuvrajS1112

New Features

New Ask Page (/ask/newinput)

- Introduced a fully redesigned Ask page at /ask/newinput as a modern alternative to /ask/input.
- Built with a ChatGPT-style composer card (NewAskComposer) featuring:
 - Auto-growing textarea with keyboard shortcut support (Cmd/Ctrl + Enter to submit).
 - Inline + Source button and Format dropdown within the composer card.
 - Real-time visual validation with shake animation and red ring on missing source or format fields at submit time.
 - Source badge chips displayed below the composer with overflow handling (+N more).
 - “See examples” quick-prompt link.

New Ask Page Layout (AskNewInputLayout)

- Added a dedicated layout component (src/app/ask/newinput/layout.tsx) that mirrors the existing /ask/input page structure, including the header, sidebar, and history panel.

New Ask Page Loading Skeleton (NewAskPageSkeleton)

- Added a pixel-accurate loading skeleton (src/components/skeletons/newAskPageSkeleton.tsx) that mirrors the real page layout while permissions resolve, providing a seamless loading experience.

Source Selection Modal

- Source picker (SourceSelectionSection) is now displayed inside a modal dialog triggered by the + Source button, keeping the composer interface clean and focused.

Improvements

PermissionGuard Enhancement

- The PermissionGuard component now accepts an optional skeleton prop, allowing pages to render context-specific loading skeletons instead of the default fallback.

UI Copy Update (AskInputStep1)

- Updated source selection section text:
 - **Title:** Select a Source → Select sources
 - **Description:** Pick the databases, files, or websites Lexlegis should consult.

Technical Improvements

- Hoisted module-level constants and pure helper functions (mapNodeToOption, fetchLibraryTree, mapSelectedItemsPure, etc.) outside component scope to prevent per-render reallocation.
- Added session-level caching for library type ID lookups using libraryTypeIdCache to reduce redundant API calls during search.
- Debounced API search requests (250ms) to minimize unnecessary network calls while typing in the source modal.
- Removed dead imports and unused state for improved code hygiene.
- Minor package-lock.json reordering with no functional changes.

Files Changed

File	Change
src/app/ask/newinput/layout.tsx	Added
src/app/ask/newinput/page.tsx	Added
src/components/ask/NewAskComposer.tsx	Added
src/components/skeletons/newAskPageSkeleton.tsx	Added
src/components/PermissionGuard.tsx	Modified
src/components/ask/AskInputStep1.tsx	Modified
package-lock.json	Modified (reorder only)

Note: The PR is currently mergeable but remains in a blocked state pending required review approvals before merging into main.
